

## Danfoss Thermostat Guide

For Heating and Hot Water

The Danfoss programmable room thermostat (*Danfoss TP5000 Si*) allows you to programme time and temperature settings each day.

When flame active, the unit is calling for heat

A thermostat measures the room temperature and activates the heating system to maintain the desired temperature.

Example thermostat temperatures:

Day time temperatures = 20°C to 21°C

Night time temperatures = 18°C to 19°C
